

IGV Group: cutting-edge technology for the lifts of the future

On the occasion of the joint event MADE expo + Sicurezza 2021, IGV Group is exhibiting a smart lift with facial recognition in collaboration with technical partner Sunell Italia Stark Solution.

Milan, September the 16th - In the new season of meetings and events, IGV Group showcases its excellence. From 22 to 24 November 2021, the international leader in vertical transportation, one of the first companies in the sector to be recognised as a Italian historical trademark, will display the innovative DomusLift platform with smart features on the occasion of Sicurezza 2021 exhibition, in collaboration with its technical partner Sunell Italia Stark Solution.

This is an important milestone: for the first time an IGV Group lift is equipped with a biometric system, thanks to the partnership with a leading sector company, specialised in the integration of solutions for video surveillance and facial recognition.

Biometric technologies are becoming increasingly popular in a variety of fields, and are being used more and more as an accurate, fast and secure means of authentication.

The optional facial recognition system on display allows users to select floors according to specific customer requirements, for use in public or private spaces. In particular, the quality of today's sensors, operating as real digital eyes, allows the system to detect faces, starting from minimal portions, even if the subject is moving. Facial recognition also solves the difficulty of having to interface with the lift, removing any potential issues for disabled users.

*"Our goal is to constantly develop advanced technology while remaining faithful to the values that made the company a leading one in the international arena," said **Michele Suria**, CEO of IGV Group. "Innovation strategies, research and new technologies will allow us to face the new year with a positive momentum and to compete in an increasingly selective market."*

The lift market is by definition connected to movement. This is the very mission and philosophy of IGV Group, striving for continuous improvement and technological innovations which have always been its cornerstones: the starting and target point in the development of each new product.

Now, AI enters the lift in order to revolutionise the travel experience of those who have chosen IGV Group, a guarantee of reliable, safe and cutting-edge solutions.

IGV Group

Leading company in the lift and lifting platform sector, it has established itself on the international market as a reference for "customised" and high-end products.

One of the first to be part in the Special Register of Italian Historical Trademarks of National Interest, set up by the Italian Ministry of Economic Development, the company was founded in 1966 by engineer Giuseppe Volpe, and over the years has consolidated its identity focused on design and technological innovation.

Today, the attention to detail and tailoring of production goes hand in hand with a growing connection with architecture and design, combined with a strong trend towards zero impact solutions.

Following in the footsteps of engineer Volpe, the current managing director, Michele Suria, has been able to enhance the combination of manufacturing excellence, carried out entirely in-house, and innovation with major investments in research and development, engineering, safety and design.

A path that has led to the birth of AD HOC: a range of lift cars with a strong identity, which transforms the lift into a design object, enhancing the space and meeting any kind of stylistic needs and requirements.

IGV Group offers a complete line of vertical transport products (homelifts, lifts, metal shafts, goods lifts, car lifts, etc.), including extremely compact solutions, designed to fit into the small spaces of residential, public, commercial and historical buildings. Today, the company exports 85% of its production to over 70 countries worldwide.
